How to read the Factsheet?	
Glossary	
Dividend History	

Disclaimer: The Factsheet is for general reading purpose only and is not meant to serve as a professional guide. This document has been prepared on the basis of publicly available information, internally developed data and other sources believed to be reliable. The Sponsor, the Investment Manager, the Trustee or any of their respective directors, employees, affiliates or representatives ("entities & their affiliates") do not assume any responsibility for, or warrant the authenticity, accuracy, completeness, adequacy and reliability of such information. Whilst no action has been solicited based upon the information provided herein; due care has been taken to ensure that the facts are accurate and opinions given are fair and reasonable. This information is not intended to be an offer or solicitation for the purchase or sale of any financial product or instrument. Recipients of this information are advised to rely on their own analysis, interpretations & investigations. Readers are also advised to seek independent professional advice order to arrive at an informed investment decision. Entities & their affiliates including persons involved in the preparation or issuance of this material may from time to time have long or short positions in and buy or sell the securities there of, of company (ies)/ specific economic sectors mentioned herein. NAV of the plan/option of certain schemes are not provided for certain cases as the NAV was not computed because there were no investors as on the date on which the NAV details are provided.

The ebb and flow of the financial markets has always been a subject of intrigue, as the winds of change can bring both prosperity and adversity. It is a dance between the forces of the past and the potential of the future, as investors must determine whether a shift in the seemingly random, continuous gyrations of the market, signifies a trend reversal or is just a fleeting pause in the beat of a larger drum of the existing trend. This inquiry into the nature of the markets, of the patterns it weaves as it finds the truth amongst the trillions of combined calculations of all the computing and human brain power at work to figure it out, is a complex, reflexive and elusive endeavour, requiring a deep understanding of the forces that shape it. Timing, in this context, becomes a symphony of intuition and critical analysis, as it helps one harmonize with the markets and seize the opportunities they present.

### Investing success depends on the ability to hear every footstep of the markets and act in concert with their movements.

There is considerable academic research with empirical evidence that the biased focus on conventional fundamental analysis helps managers generate alpha by buying at the right time, but their selling decisions underperform substantially, even relative to random selling. Put bluntly, a random set of sell decisions would do better than the average money manager. We believe this is a significantly overlooked factor in investing, and one, that we want to move beyond, by giving primary importance to the timing of our decisions. It is the essence of adaptive asset allocation – adapt and generate alpha, or underperform.

Though its conventionally considered a risky strategy, we have a different perspective – **timing and investing are inseparable activities**. Any investing act has a component of timing that irreversibly affects the value derived from the investment. In contemporary times, this observation is even backed up by the US Federal Reserve's role in the global financial system. The timing of rate decisions is paramount in determining whether policy action is constructive or destructive and even the US Fed recognizes this simple fact. By logical extension, the entire global financial system is based on the same principle which we explicitly state as a core part of our money management – 'timing is everything'.

We believe investing with a 'perpetuity' mindset leads to sub-optimal results as it leads to value traps, more detrimental effects of behavioral biases, as well as leads to a comfortable but static approach in an ever-changing world. Long-term investing is about staying invested in markets while dynamically timing the asset allocation and sector rotation. This approach may have worked during a unidirectional multi-decade trend, however, in the period of radical change that we are in now, dynamic money management has become necessary. The science of timing needs to be given focus at par with other dimensions of investing.

Time manifests itself in the world through probability distributions. There is never a fixed future, only probabilities of possible futures. Effective money management is about investing based on how these ripples in time manifest through the dimensions of risk, liquidity and valuations. Through the Predictive Analytics set of indicators and VLRT investment framework, we have designed and implemented a money management process that is probabilistic by design.

The vision is to position better and mitigate risk of future market movements by quantifying possible future states of the global order and taking decisions that are the result of probabilistic weights.

absolute

### **Investment Philosophy**

In a dynamic world that is continuously changing due to technology and increasingly volatile geopolitics, passive investment strategies can no longer outperform. Alpha belongs to active strategies that can invest in sync with the dynamics at play.

Being relevant comes by staying active

We believe consistent outperformance requires complete freedom from looking at the world relatively. It is why we design investment strategies with an absolute objective irrespective of market conditions. With this absolute objective, comes clarity of thought

### Being relevant requires an absolute focus on returns

Embedded within our processes and systems is the conviction that the surest way to success in investing is through cultivation of a multitude of opinions and perspectives. By bringing together this diversity of ideas within our investment framework, we aim to unearth every possible opportunity in any set of circumstances

Being relevant means having an unconstrained perspective

ideas are the inspiration for our perspective on investment research and money management 'Atman' is the 'true' or 'absolute' self of a person, beyond all names and subjective judgements that the world and the person choose to apply on themself. In that sense, real assets and profitgenerating capacity of all economic entities and participants are the 'fundamentals' underlying every kind of market. Without the Atman, an individual cannot exist. Similarly, without fundamentals,

**Core Beliefs** 

One of the oldest scriptures and philosophy in the world is the Vedic philosophy. These scriptures are a comprehensive effort to describe all aspects of the universe and human existence. To undertake this gigantic task, they rely on three core ideas - Atman, Prana and Maya. These

FUNDAMENTAL

Is atman

value cannot persist

'Prana' refers to universal energy in all it's forms. It is the vibrational force that makes every electron and atom vibrate and move. For markets, the dynamic flow of money which we study as liquidity, enables participants to undertake economic activity and create an ecosystem. While Prana enables life, liquidity imparts a 'value' to assets and organisations.

'Maya' depicts the illusion of this world as subjectively experienced by all humans. Each person imagines the world to be in a peculiar way, based on their own opinions and perceptions, and lives accordingly. 'Price' is the illusion market participants assign to every economic unit, according to their subjective ideas of the present and the future, based on a myriad assumptions, experiences and predictions. Maya is the intricate illusion of this universe created by our minds and price is the ever-changing perception of economic value created by investors

### **Investment Principles**

# MEASURABLE

**Measurable is reliable:** For success in investing, discipline is of more importance than any other attribute of the investment process. Our battle-tested suite of proprietary valuation, liquidity and risk indicators along with extensive financial modelling ensure that we consistently deliver superior results

# QUANTAMENTAL INVESTING

**Quantamental investing:** While measurable is reliable, we also believe the economy and markets cannot be captured completely by models and indicators. Human judgement that comes from years of trading and investing experience has immense value. For optimal results, our decision-making seeks to find the harmony between objectivity and subjectivity

**Multi-asset, multi-manager:** We believe that safeguarding investor wealth is paramount. Apart from reducing risk by investing across asset classes, we take diversification to another dimension by ensuring every investment decision comes from a focused discussion between investment managers with a diverse set of capabilities and experience

MONEY FLOWS F ₹ O M O N E ASSET CLASS T O A N O T H E ₹

**Timing is everything:** In our framework, time is a critical aspect of investing as the three dimensions of Valuation, Liquidity and Risk interact and move together in cycles across different periods. Alpha generation is optimised only by sanguine identification of the extremes.

### Adaptive money management – VLRT Framework

VLRT

# Being Relevant with 'predictive analytics'

The core engine that drives us and sets us apart is a robust and differentiated investment framework that enables us to see beyond the horizon and stay relevant. Our unique analytical framework for enabling 'predictive analytics' encompasses all available asset classes and sectors, formulating a multi-dimensional research perspective.

### Why multi-dimensional?

The markets are a complex, dynamic system. There is no one formula or strategy or perspective that can consistently outperform. A diverse set of variables and participants are continuously interacting with each other in myriad ways.

In the face of this uncertainty and complexity, instead of limiting ourselves to any one school of thought we have found consistent success by studying markets along four dimensions: Valuation, Liquidity, Risk Appetite, and Time [VLRT]

Knowing the difference between price and value.

# quant Value Fund

quant Value Fund investments goes beyond selecting securities merely on the basis of a statistical measure indicating which stocks are less expensive. Using multi-dimensional research and Predictive Analytics, the fund endeavors to distinguish temporary cycles from permanent shifts and if the change is secular, to accurately estimate its impact. This scheme is ideal for long-term investors with high risk appetite. This scheme has a delivered a return of 91.12% in between November 30, 2021 and March 28, '24 with a portfolio beta of 1.21.

# quant Value Fund

Investment Objective: The primary investment objective of the scheme is to seek to achieve capital appreciation in the long-term by primarily investing in a well-diversified portfolio of value stocks. However, there can be no assurance that the investment objective of the Scheme will be realized, as actual market movements may be at variance with anticipated trends.

# quant Dynamic Asset Allocation Fund

quant Dynamic Asset Allocation Fund (DAAF) offers highest flexibility to switch between low-risk debt and high risk equity instruments based on the Risk-On/Risk-Off environment. Minimum 65% equity exposure is maintained to avail equity taxation while derivatives can be used to hedge up to 100% of equity exposure. Brings maximum possible diversification in a single portfolio and moderates portfolio volatility by limiting extreme outcomes and optimizing inflection points. Active rebalancing is done to adapt to macro environment. This scheme is ideal for low risk appetite investors. This scheme has a delivered a return of 54.69% in between April 12, 2023 and March 28, '24 with a portfolio beta of 0.99.

# **Liquidity Analytics**

- Liquidity Analytics indicates number of days that will be required to liquidate 50% and 25% of the portfolio respectively on a pro-rata basis, under certain conditions.
- For this 3 times the combined volumes on NSE and BSE has been considered.
- Assuming a participation of 10%, number of days to liquidate each stock is calculated.
- While calculating the time taken to liquidate portfolio on pro-rata basis, the 20% of least liquid securities of the portfolio are ignored.
- The number of days required to liquidate the balance portfolio shall be the maximum number of days required for liquidating a stock in such portfolio. Such number of days would be divided by two to indicate the days required for liquidating 50% portfolio and by four to indicate days required to liquidate 25% of the portfolio.
- The above methodology is as per the guidelines issued by AMFI in consultation with SEBI in relation to mid and small cap schemes. We are extending the same methodology to all our schemes and its respective benchmarks as well, after rebasing the size of the benchmark to the respective schemes' AUM.

# How to read the Factsheet?

# **INVESTMENT OBJECTIVE**

The inception date marks the starting point from which the fund's performance and history are measured. It is important for investors because it provides insight into the fund's track record, allowing them to assess historical performance and other key metrics since inception.

Market capitalization (commonly known as market cap) is calculated by multiplying a company's outstanding shares by its stock price per share. The contribution by market cap indicates the proportion of the fund's assets invested in companies of different sizes, typically categorized into:

- Large-cap: Top 100 listed companies based on previous 6 month average market cap.
- Mid-cap: Next 150 listed companies based on previous 6 month average market cap.
- Small-cap: All companies beyond top 250 listed companies based on previous 6 month average market cap.

Fund's allocation towards different market capitalization is subject to its allocation limits as specified in the Scheme Investment Document (SID). Moreover, this allocation also underscores the fund's prevailing investment strategy, which is influenced by the risk-off/risk-on dynamics observed across various market cycles.

# PORTFOLIO CONCENTRATION

This data helps in understanding the extent to which the fund's assets are invested in a limited number of securities (commonly known as portfolio concentration). It indicates how diversified or concentrated the portfolio is.

The level of portfolio concentration can impact the fund's risk and return profile. A concentrated portfolio may offer the potential for higher returns if the selected securities perform well, but it also carries higher risks due to the lack of diversification. On the other hand, a diversified portfolio aims to reduce risk by spreading investments across different securities, potentially mitigating the impact of poor performance from any single security; however, it may also limit the potential for outsized returns if a particular sector or security experiences significant growth.

# **INVESTOR CONCENTRATION**

Investor concentration refers to the distribution of AUM among the fund's investors. It's essentially the extent to which the fund's AUM is held by a relatively small number of investors versus being spread across a larger investor base.

Fund managers are experienced professionals with expertise in financial markets, securities analysis, and portfolio management. Their knowledge and skills are essential for selecting suitable investments, managing risk, and optimizing returns for investors.

They are tasked with constructing and rebalancing the fund's portfolio to achieve its investment objectives. They decide which securities to buy, hold, or sell based on market conditions, economic trends, and the fund's strategy.

Benchmark indices serve as reference points for investors, providing a standard against which they can evaluate a fund's performance. These indices represent specific market segments or asset classes and act as benchmarks for measuring the relative success of funds. Comparing a fund's performance to its benchmark index helps investors gauge how effectively the fund's manager has achieved investment objectives and managed risk.

The risk-o-meter is a standardized tool depicted through a pictorial meter implemented by market regulators to quantify the level of risk associated with investing in a particular fund. It is typically graphic representation which ranks funds on a scale from low to high risk namely (i) low, (ii) moderately low, (iii) moderate, (iv) moderately high and (v) high., helping investors assess the risk profile of a fund before investing. By understanding the risk level indicated by the risk-o-meter, investors can align their investment decisions with their risk tolerance and financial goals, ensuring they select funds that match their preferences for risk and return.

# How to read the Factsheet?

# PORTFOLIO TOP HOLDING

The Top Holding in a fund refers to the fund's largest investment holdings, typically representing the highest allocation of assets within the portfolio. For investors, understanding the top holdings is crucial as it provides insight into the fund's investment strategy and the sectors or companies the fund manager believes offer the most potential. By knowing the top holdings, investors can assess the fund's diversification, concentration, and alignment with their own investment objectives. Monitoring changes in Top Holdings over time can also reveal shifts in the fund manager's strategy or market trends.

This graph represents how the fund's sectoral exposure differs from the market benchmark. By identifying over- or underweight sectors, investors can gauge the fund manager's active decisions and provide insights into the fund manager's sectoral preferences, deviations from the benchmark, and potential sources of outperformance or underperformance. This data helps to evaluate the fund's positioning and sector rotation strategy.

Exit load refers to a fee charged by the fund when an investor redeems or sells their units within a specified period after purchasing them. This fee is designed to discourage short-term trading and to cover administrative costs associated with processing redemptions. Exit loads are typically expressed as a percentage of the redeemed amount and vary depending on the scheme and the duration for which the investment was held. Investors should be aware of exit loads before investing as they can affect the overall returns, especially for short-term investments.

# SCHEME PERFORMANCE

By providing the funds' historical performance data, a clear picture is obtained of how the fund has fared in the market across time frames. In line with the SEBI Regulations, fund fact sheet discloses the scheme performance for the 1-year, 3-year, 5-year period and from the scheme inception date. Further, the performance of the benchmark index (Total Return Index) is also shared along with the scheme performance for ease of comparison by the investors. The scheme performance for the period longer than one year is disclosed in CAGR (Compounded Annual Growth Returns) terms.

SIP returns refer to the returns generated by investing through a systematic investment plan. SIP is a method of investing a fixed amount regularly, into a mutual fund scheme. SIP returns reflect the compounded growth of investments made through SIP over a specific period. Since SIP involves investing fixed amounts at regular intervals, it helps investors benefit from rupee-cost averaging and may potentially reduce the impact of market volatility on their investments.

# **RISK ADJUSTED MEASURES**

Capture Ratios provide a more comprehensive assessment of risk-adjusted performance by incorporating both risk and return metrics, thereby offering a clearer picture of a fund's overall performance, risk profile and the fund's ability to outperform benchmarks, providing investors with a more nuanced understanding of the fund's performance relative to its risk exposure.

# Glossary

### The ratios provided are based on three years of historical data, where available.

## Sharpe Ratio:

**Definition:** The Sharpe Ratio measures the risk-adjusted performance of an investment or portfolio. It measures portfolio returns generated in excess to the investment in risk-free asset, for per unit of total risk taken. While, positive Sharpe ratio indicates, portfolio compensating investors with excess returns (over risk-free rate) for the commensurate risk taken; negative Sharpe ratio indicates, investors are better off investing in risk-free assets.

## Formula:

Sharpe Ratio = (Rp - Rf) /  $\sigma p$ Rp: Average return of the portfolio Rf: Risk-free rate of return  $\sigma p$ : Standard deviation of the portfolio's returns

## Interpretation:

A higher Sharpe Ratio indicates better risk-adjusted performance.

## Sortino Ratio:

**Definition:** The Sortino Ratio is a variation of the Sharpe Ratio, focusing on the downside risk. It considers only the standard deviation of the negative returns (downside deviation) when assessing risk.

## Formula:

Sortino Ratio = (Rp - Rf) /  $\sigma$ d Rp: Average return of the portfolio Rf: Risk-free rate of return  $\sigma$ d: Downside deviation (standard deviation of negative returns)

### Interpretation:

A higher Sortino Ratio indicates better risk-adjusted performance, but it specifically addresses the downside risk.

## Jensen's Alpha:

**Definition:** Jensen's Alpha, also known as the Jensen Index or Jensen's Performance Index, measures the excess return of an investment or portfolio compared to its expected return, given its level of risk as measured by the capital asset pricing model (CAPM).

## Formula:

Jensen's Alpha = Rp - [Rf + βp (Rm - Rf)] Rp: Actual portfolio return Rf: Risk-free rate of return βp: Beta of the portfolio (systematic risk) Rm: Market return

### Interpretation:

A positive Jensen's Alpha suggests that the portfolio has outperformed its expected return based on its level of risk.

### **R-Squared:**

Definition: R-Squared (Coefficient of Determination) measures the proportion of the variation in the portfolio's returns that can be explained by the variation in the benchmark's returns. It ranges from 0 to 1, where 0 indicates no correlation, and 1 indicates a perfect correlation.

### Formula:

Calculated as part of the regression analysis comparing the portfolio's returns to the benchmark's returns.

### Interpretation:

A higher R-Squared indicates a stronger correlation between the portfolio and its benchmark.

## **Downside Deviation:**

## Definition:

Downside Deviation measures the volatility of the returns that fall below a certain minimum acceptable return or threshold (often the risk-free rate).

## Formula:

Standard deviation of returns that are below the threshold.

### Interpretation:

A lower downside deviation suggests less volatility in the undesirable direction (below the threshold), indicating better risk management.

## Upside Deviation:

## Definition:

Upside Deviation measures the volatility of the returns that exceed a certain minimum acceptable return or threshold (often the risk-free rate).

Formula: Standard deviation of returns that are above the threshold.

## Interpretation:

A lower upside deviation indicates less volatility in the favorable direction (above the threshold), suggesting a more stable and consistent performance in positive market conditions.

## Example:

Assume the following data for Fund ABC and the benchmark over a specific period:

Average Fund Return: 12%

- Risk-Free Rate: 3%
- Standard Deviation of Fund Returns: 15%
- Downside Deviation: 8%
- Beta (Systematic Risk): 1.2
- Market Return: 10%
- Actual Portfolio Return: 14%
- Correlation coefficient with the Market: 0.8
- Positive Returns: 5%, 8%, 12%, 15%, 18%
- Negative Returns: -2%, -4%, -1%, -5%, -3%

Sharpe Ratio = (Average Return - Risk-Free Rate) / Standard Deviation of Returns Sharpe Ratio = (12% - 3%) / 15% = 0.6

Sortino Ratio = (Average Return - Risk-Free Rate) / Downside Deviation Sortino Ratio = (12% - 3%) / 8% = 1.12

Jensen's Alpha = Actual Portfolio Return - [Risk-Free Rate + Beta \* (Market Return - Risk-Free Rate)] Jensen's Alpha = 14% - (3% + 1.2 \* (10% - 3%)) = 2.6%

R-Squared = (Correlation coefficient)^2 R-Squared =  $(0.8)^2 = 0.64$ 

Downside Deviation = Square Root of (Average of Squared Negative Returns) Downside Deviation  $\approx$  Square Root of [(-2%)^2 + (-4%)^2 + (-1%)^2 + (-5%)^2 + (-3%)^2 / 5]  $\approx$  3.06%

Upside Deviation = Square Root of (Average of Squared Positive Returns) Upside Deviation  $\approx$  Square Root of [(5%)<sup>2</sup> + (8%)<sup>2</sup> + (12%)<sup>2</sup> + (15%)<sup>2</sup> + (18%)<sup>2</sup> / 5]  $\approx$  6.88%

\$-ICRA's mutual fund rating methodology is based on evaluating the inherent credit quality of the fund's portfolio. As a measure of the credit quality of a debt fund's assets. ICRA uses the concept of 'credit scores'. These scores are based on ICRA's estimates of credit risk associated with each exposure of the portfolio taking into account its maturity. To quantify the credit risk scores, ICRA uses its database of historical default rates for various rating categories for various maturity buckets. The credit risk ratings incorporate ICRA's assessment of a debt fund's published investment objectives and policies, its management characteristics, and the creditworthiness of its investment portfolio. ICRA reviews relevant fund information on an ongoing basis to support its published rating opinions. If the portfolio credit score meets the benchmark of the assigned rating during the review, the rating is retained. In an event that the benchmark credit score within the benchmark credit score. If the debt fund manager is able to reduce the portfolio still continues to breach the benchmark credit score, the rating is revised to reflect the change in credit quality.
